Prototyping/Wireframing
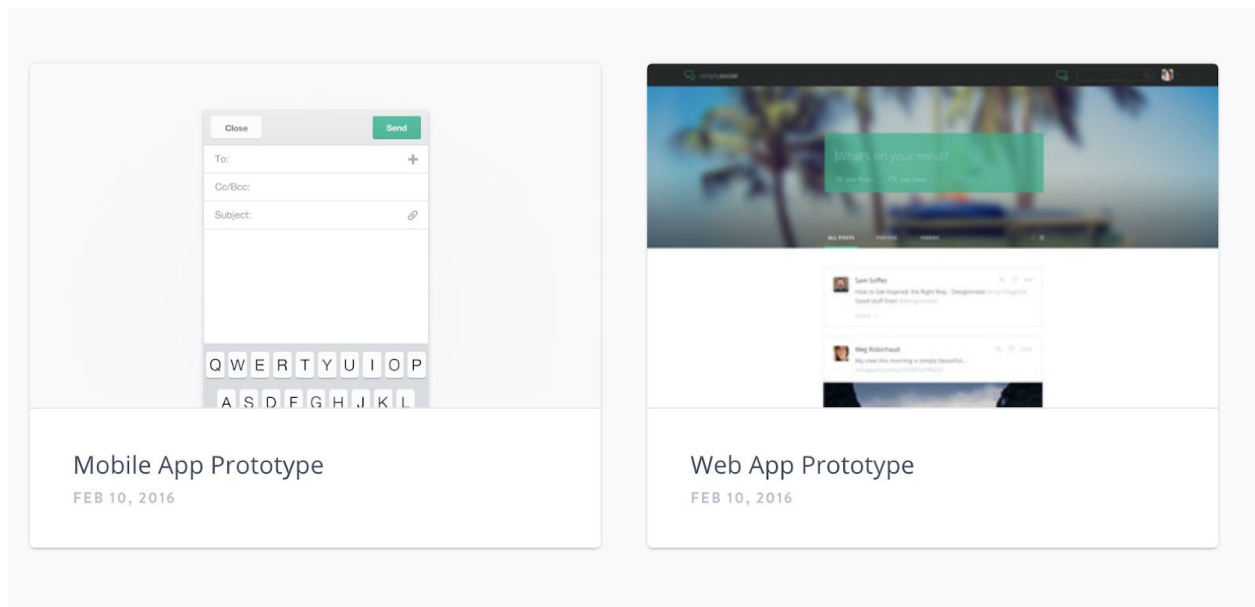

In regard to wireframes/prototypes there are numerous free and paid tools available.

Personally, I like InVision for prototyping because it's easy to use and free ☺

When you create an account, you are given some example prototypes, feel free to test the two below:

1. Mobile app example
2. Web app example

Basically, you upload screenshots of an image and add hot spots (shown in blue, below) allowing you to transition to different screens.

There is also an InVision app for mobile which these prototypes can be ported too, giving the user a more real experience as well.

Uploading screenshots to InVision
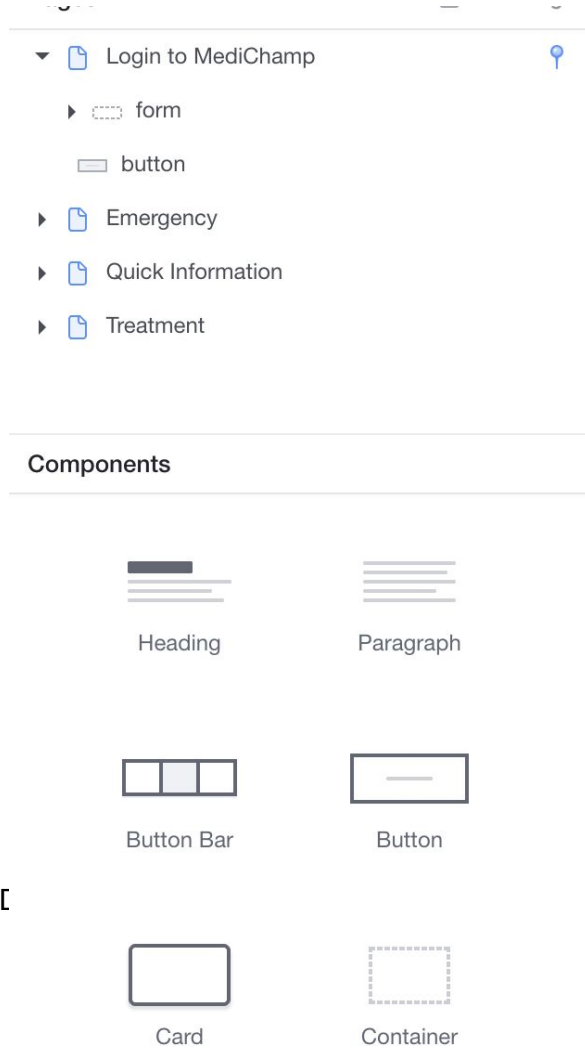

Wireframe example, much simpler design created with InVIsion

In terms of wireframing tools I like Ionic Creator, Balsamiq or Moqups.

The immediate benefit of wireframing tools is that you are given components so there is no need to use photoshop or Adobe XD
